What happened last week?

- Had to push the sprint to two weeks due to excessive due dates.
- Finished 7 of the developer stories
- Fixed Travis deploy to azure

Personal Retrospectives:

Duncan

I added basic use voting this week, the implementation works as intended and only allows one user to vote per person. I managed to fix the azure deployment from Travis which will help the progress of the team to test end functionality.

Tori

I added functionality to list group invite notifications and to let people accept or decline the invites.

Blake

I added a new login and register screen, and randomly suggest a group that a user is not apart of.

Jon

Added ability to add any member to a group *user story*. Also added Jest ADR and read a lot about Jest 😊 help from @Victoria Bench, thaaaaaaaanks

Josh

Tried to change the determineMeetingLocation function to use the centralLocation algorithm. Need to populate a meeting with hard coded user to test it.

What are we doing this week?

Make some diagrams for further UI development. Mostly implement group features, redesign landing page, add activity log and covid screening survey.

Potential blockers?

Project hand-ins for the 7th June.

Velocity

7 dev stories fourth + fifth week.

9 dev stories third week.

8 dev stories second.

6 dev stories first week.

Sprint velocity = 6 d.s/week average
